

Breaking  
Broadband  
Barriers

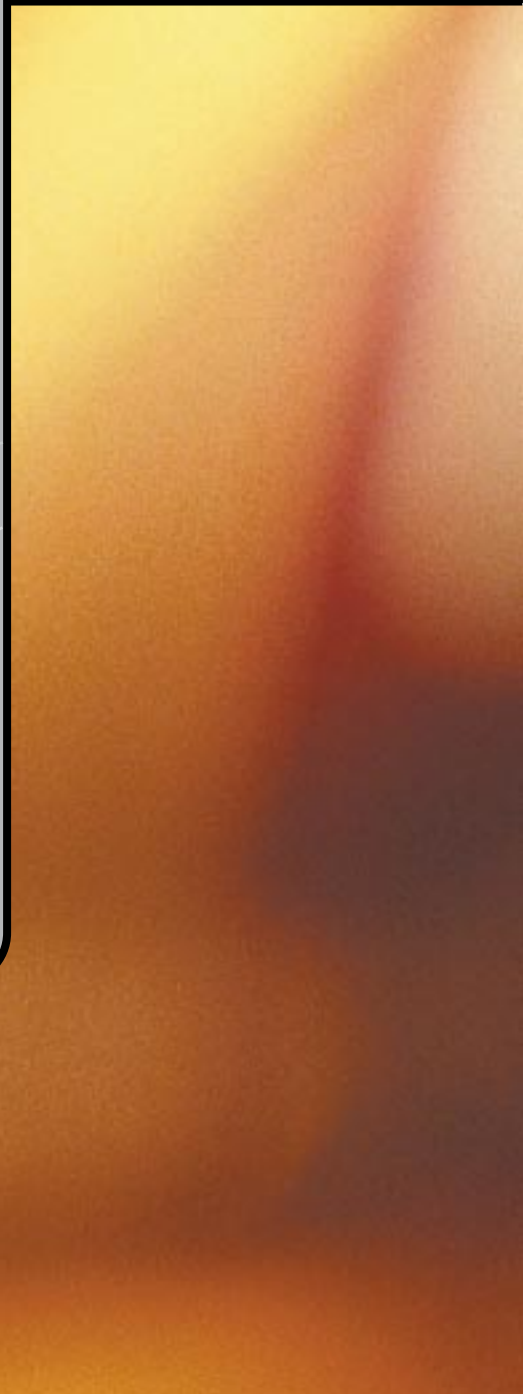

## AN UNMET MARKET NEED

According to current estimates of worldwide Internet use, there will be roughly 250 million new Internet users by 2005. Additionally, the unlicensed wireless equipment market is estimated to grow to over \$3 billion over the same time period. Residential and small business Internet users within the U.S. are demanding faster, more reliable connections than those offered by traditional dial-up service. Outside the U.S., dial-up service is limited or non-existent due to regulatory forces and the lack of wired infrastructure.

Global service providers want to meet this market need, however equipment costs and deployment limitations have impeded the process. ISPs are requiring a one-year return-on-investment to enable them to justify full-scale market deployments.

CIRRONET™ Inc. is enabling the residential and small business wireless Internet access market to emerge by delivering uniquely designed first-in-category broadband wireless equipment that eliminates price and deployment barriers for worldwide ISPs.

## AFFORDABLE WIRELESS INTERNET

CIRONET's WaveBolt™ family of products enables cost-effective and quickly deployable high-speed residential and small business connections because it is compact, end-user installed through a PC port, priced under \$400 USD (including customer premise equipment, amortized access point and installation costs), and approved to operate globally in the unlicensed 2.4 GHz (ISM) frequency band.

The WaveBolt system provides Internet access worldwide without telephone connection charges or spectrum licensing costs and delays - allowing service providers to rapidly acquire new subscribers and accelerate market penetration.

## THE WaveBolt DIFFERENCE

The WaveBolt™ family of products offers an attractive solution for broadband wireless Internet access based on its ease of installation, affordability and market coverage capability.

### WaveBolt™:

- Breaks the price-point barrier at under \$400 USD for residential high-speed Internet access
- Breaks deployment barriers through subscriber installation - no technician or truck-roll needed
- Operates in the unlicensed 2.4 GHz band reducing cost and time-to-market
- Operates worldwide utilizing the same product that is compliant with all U.S. and international standards
- Has near line-of-site range up to 8 km that eases network planning topology
- Offers high-speed bandwidth with typical down load rates comparable to DSL and cable modem
- Offers investment protection by using proprietary, spread spectrum frequency-hopping technology that is virtually impossible to jam

## ABOUT CIRRONET INCORPORATED

CIRRONET™ Inc. is changing how ISPs provide last-mile Internet access solutions to residential and small business customers worldwide. The company develops, markets and globally supports commercially proven broadband wireless access solutions that are uniquely designed to minimize price and deployment barriers.

Founded in 1987 and profitable since 1996 with a strong track record in industrial wireless data products, CIRRONET™ has developed products for numerous critical applications such as real-time monitoring of heart patient EKG waveforms in hospitals and radiation levels in nuclear power plants. The company has created a global footprint with commercially deployed broadband wireless access systems by using their experience with wireless technology and proven practical engineering techniques.
